

EZ.9 - MATHS 4
(EE - 2nd yr)

UNIVERSITY OF LONDON

[II(4)E 2005]

B.ENG. AND M.ENG. EXAMINATIONS 2005

For Internal Students of Imperial College

This paper is also taken for the relevant examination for the Associateship of the City & Guilds of London Institute

PART II : MATHEMATICS 4 (ELECTRICAL ENGINEERING)

Thursday 2nd June 2005 2.00 - 4.00 pm

Answer FOUR questions.

Answer questions from Section A and Section B in separate answerbooks.

A statistics data sheet is provided.

[Before starting, please make sure that the paper is complete; there should be 4 pages, with a total of 6 questions. Ask the invigilator for a replacement if your copy is faulty.]

Copyright of the University of London 2005

SECTION A

1. Find the eigenvalues and normalized eigenvectors of the matrix

$$A = \begin{pmatrix} 2 & \sqrt{6} & 0 \\ \sqrt{5} & 1 & 0 \\ 0 & 0 & 3 \end{pmatrix}.$$

Using these, or otherwise, show that the matrix

$$P = \begin{pmatrix} \sqrt{\frac{3}{5}} & \sqrt{\frac{2}{5}} & 0 \\ \sqrt{\frac{2}{5}} & -\sqrt{\frac{3}{5}} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

diagonalizes A such that

$$P^{-1}AP = \begin{pmatrix} 4 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 3 \end{pmatrix}.$$

2. Show that the quadratic form

$$Q = x_1^2 + 4x_1x_2 + 4x_2^2 + 6x_3^2$$

can be written as

$$Q = \mathbf{x}^T A \mathbf{x},$$

where $\mathbf{x} = (x_1, x_2, x_3)^T$ and A is a real symmetric matrix, which is to be found. Hence show that Q can be re-expressed in the diagonal form

$$Q = \lambda_1 y_1^2 + \lambda_2 y_2^2 + \lambda_3 y_3^2,$$

where the λ_i are to be determined, by finding a matrix P that satisfies $\mathbf{x} = P\mathbf{y}$ where $\mathbf{y} = (y_1, y_2, y_3)^T$. Find y_1 , y_2 and y_3 in terms of x_1 , x_2 and x_3 from the matrix P .

PLEASE TURN OVER

SECTION B

- 3 (i) Suppose that

$$P(A) = \frac{1}{2}, \quad P(B) = \frac{7}{12}, \quad P(C) = \frac{3}{4},$$

$$P(A \cap B) = P(A \cap C) = P(B \cap C) = \frac{1}{3} \quad \text{and} \quad P(A \cap B \cap C) = \frac{1}{6}.$$

Calculate $P(B \cup C)$, $P(A \cup B)$, $P(A|B)$ and $P(A \cup B|B \cap C)$.

- (ii) In a sequence of success/failure trials the probability of a success is p if the preceding trial was a success, and q if it was a failure. The initial state, preceding trial number 1, is taken to be a success.

What are the probabilities that

- (a) trials 2 and 3 are both successes ?
- (b) no two consecutive trials have the same outcome in trials 1 to 6?
4. A certain discrete distribution, in which the random variable N takes integer values $(0, 1, 2, \dots)$, is defined by the system of equations

$$P(N = r + 1) = \frac{\lambda}{r + 1} P(N = r) \quad \text{for} \quad r = 0, 1, 2, \dots$$

Why does this system of equations imply that $\lambda \geq 0$? What does $\lambda = 0$ imply about $P(N = r)$?

Derive the relationship

$$P(N = r + 1) = \frac{\lambda^2}{(r + 1)r} P(N = r - 1),$$

express $P(N = r)$ in terms of $P(N = 0)$, and derive an explicit expression for $P(N = r)$ in terms of r and λ .

Calculate $P(N = r | N > 0)$ and $E(N | N > 0)$.

5. The random variables Y_1 and Y_2 are independent, each generated from the distribution with density $f(y) = ye^{-y}$ on $(0, \infty)$. Write down the joint density of Y_1 and Y_2 and the conditional density of Y_2 given Y_1 .

Calculate $E(Y_1)$, $E(3Y_1 - 2Y_2)$ and $E(Y_1 Y_2)$.

Derive the identity

$$P(Y_2 > 2Y_1) = \int_0^{\infty} y(2y + 1)e^{-3y} dy .$$

Given that this integral has value $7/27$, calculate the probability that the larger of Y_1 and Y_2 exceeds twice the smaller of Y_1 and Y_2 .

6. A random sample, (y_1, \dots, y_n) , is available from the uniform distribution on $(0, \theta)$. Let $y_{min} = \min(y_1, \dots, y_n)$ and $y_{max} = \max(y_1, \dots, y_n)$ denote the sample minimum and maximum, respectively.

Derive

$$P(y_{max} \leq u) = (u/\theta)^n \quad (0 \leq u \leq \theta) .$$

Hence, write down the density function of y_{max} and use it to calculate $E(y_{max})$ and $\text{var}(y_{max})$.

Given that $E(y_{min}) = \theta/(n + 1)$, compare the estimators y_{max} and ny_{min} of θ in terms of bias.

Given also that $\text{var}(y_{min}) = n\theta^2 / \{(n + 1)^2(n + 2)\}$, calculate the ratio of variances, $\text{var}(ny_{min})/\text{var}(y_{max})$.

END OF PAPER

MATHEMATICAL FORMULAE

1. VECTOR ALGEBRA

$$\mathbf{a} = a_1\mathbf{i} + a_2\mathbf{j} + a_3\mathbf{k} = (a_1, a_2, a_3)$$

Scalar (dot) product: $\mathbf{a} \cdot \mathbf{b} = a_1b_1 + a_2b_2 + a_3b_3$

Vector (cross) product:

$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}$$

Scalar triple product:

$$[\mathbf{a}, \mathbf{b}, \mathbf{c}] = \mathbf{a} \cdot \mathbf{b} \times \mathbf{c} = \mathbf{b} \cdot \mathbf{c} \times \mathbf{a} = \mathbf{c} \cdot \mathbf{a} \times \mathbf{b} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Vector triple product: $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{c} \cdot \mathbf{a})\mathbf{b} - (\mathbf{b} \cdot \mathbf{a})\mathbf{c}$

2. SERIES

$$(1+x)^\alpha = 1 + \alpha x + \frac{\alpha(\alpha-1)}{2!}x^2 + \frac{\alpha(\alpha-1)(\alpha-2)}{3!}x^3 + \dots \quad (\alpha \text{ arbitrary, } |x| < 1)$$

$$e^x = 1 + x + \frac{x^2}{2!} + \dots + \frac{x^n}{n!} + \dots,$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots + (-1)^n \frac{x^{2n}}{(2n)!} + \dots,$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \dots,$$

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots + (-1)^n \frac{x^{n+1}}{(n+1)} + \dots \quad (-1 < x \leq 1)$$

3. TRIGONOMETRIC IDENTITIES AND HYPERBOLIC FUNCTIONS

$$\sin(a+b) = \sin a \cos b + \cos a \sin b;$$

$$\cos(a+b) = \cos a \cos b - \sin a \sin b.$$

$$\cos iz = \cosh z; \quad \cosh iz = \cos z; \quad \sin iz = i \sinh z; \quad \sinh iz = i \sin z.$$

4. DIFFERENTIAL CALCULUS

(a) Leibniz's formula:

$$D^n(fg) = f D^n g + \binom{n}{1} Df D^{n-1} g + \dots + \binom{n}{r} D^r f D^{n-r} g + \dots + D^n f g.$$

(b) Taylor's expansion of $f(x)$ about $x = a$:

$$f(a+h) = f(a) + hf'(a) + \frac{h^2}{2!} f''(a) + \dots + \frac{h^n}{n!} f^{(n)}(a) + \epsilon_n(h),$$

where $\epsilon_n(h) = h^{n+1} f^{(n+1)}(a + \theta h) / (n+1)!$, $0 < \theta < 1$.

(c) Taylor's expansion of $f(x, y)$ about (a, b) :

$$f(a+h, b+k) = f(a, b) + [hf_x + kf_y]_{a,b} + \frac{1}{2!} [h^2 f_{xx} + 2hk f_{xy} + k^2 f_{yy}]_{a,b} + \dots$$

(d) Partial differentiation of $f(x, y)$:

i. If $y = y(x)$, then $f = F(x)$, and $\frac{dF}{dx} = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} \frac{dy}{dx}$.

ii. If $x = x(t)$, $y = y(t)$, then $f = F(t)$, and $\frac{dF}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}$.

iii. If $x = x(u, v)$, $y = y(u, v)$, then $f = F(u, v)$, and

$$\frac{\partial F}{\partial u} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial u}, \quad \frac{\partial F}{\partial v} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial v}.$$

(e) Stationary points of $f(x, y)$ occur where $f_x = 0$, $f_y = 0$ simultaneously.

Let (a, b) be a stationary point: examine $D = [f_{xx}f_{yy} - (f_{xy})^2]_{a,b}$.

If $D > 0$ and $f_{xx}(a, b) < 0$, then (a, b) is a maximum;

If $D > 0$ and $f_{xx}(a, b) > 0$, then (a, b) is a minimum;

If $D < 0$ then (a, b) is a saddle-point.

(f) Differential equations:

i. The first order linear equation $dy/dx + P(x)y = Q(x)$ has an integrating

factor $I(x) = \exp[\int P(x)dx]$, so that $\frac{d}{dx}(Iy) = IQ$.

ii. $P(x, y)dx + Q(x, y)dy = 0$ is exact if $\partial Q/\partial x = \partial P/\partial y$.

7. LAPLACE TRANSFORMS

Function	Transform	Function	Transform
$f(t)$	$F(s) = \int_0^\infty e^{-st} f(t) dt$	$\alpha f(t) + b g(t)$	$aF(s) + bG(s)$
df/dt	$sF(s) - f(0)$	$d^2 f/dt^2$	$s^2 F(s) - sf(0) - f'(0)$
$e^{at} f(t)$	$F(s - a)$	$tf(t)$	$-dF(s)/ds$
$(\partial/\partial\alpha)f(t, \alpha)$	$(\partial/\partial\alpha)F(s, \alpha)$	$\int_0^t f(t) dt$	$F(s)/s$
$\int_0^t f(u)g(t-u)du$	$F(s)G(s)$		
1	$1/s$	$t^n (n = 1, 2, \dots)$	$n!/s^{n+1}, (s > 0)$
e^{at}	$1/(s - a), (s > a)$	$\sin \omega t$	$\omega/(s^2 + \omega^2), (s > 0)$
$\cos \omega t$	$s/(s^2 + \omega^2), (s > 0)$	$H(t - T) = \begin{cases} 0, & t < T \\ 1, & t > T \end{cases}$	$e^{-sT}/s, (s, T > 0)$

8. FOURIER SERIES

If $f(x)$ is periodic of period $2L$, then $f(x + 2L) = f(x)$, and

$$f(x) = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{L} + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{L}, \text{ where}$$

$$a_n = \frac{1}{L} \int_{-L}^L f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, \dots, \text{ and}$$

$$b_n = \frac{1}{L} \int_{-L}^L f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots$$

Parseval's theorem

$$\frac{1}{L} \int_{-L}^L [f(x)]^2 dx = \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2).$$

5. INTEGRAL CALCULUS

(a) An important substitution: $\tan(\theta/2) = t$.
 $\sin \theta = 2t/(1 + t^2), \quad \cos \theta = (1 - t^2)/(1 + t^2), \quad d\theta = 2 dt/(1 + t^2).$

(b) Some indefinite integrals:

$$\int (a^2 - x^2)^{-1/2} dx = \sin^{-1} \left(\frac{x}{a} \right), \quad |x| < a.$$

$$\int (a^2 + x^2)^{-1/2} dx = \sinh^{-1} \left(\frac{x}{a} \right) = \ln \left\{ \frac{x}{a} + \left(1 + \frac{x^2}{a^2} \right)^{1/2} \right\}.$$

$$\int (x^2 - a^2)^{-1/2} dx = \cosh^{-1} \left(\frac{x}{a} \right) = \ln \left| \frac{x}{a} + \left(\frac{x^2}{a^2} - 1 \right)^{1/2} \right|.$$

$$\int (a^2 + x^2)^{-1} dx = \left(\frac{1}{a} \right) \tan^{-1} \left(\frac{x}{a} \right).$$

6. NUMERICAL METHODS

(a) Approximate solution of an algebraic equation:

If a root of $f(x) = 0$ occurs near $x = a$, take $x_0 = a$ and $x_{n+1} = x_n - [f(x_n)/f'(x_n)], \quad n = 0, 1, 2, \dots$

(Newton Raphson method).

(b) Formulae for numerical integration: Write $x_n = x_0 + nh, \quad y_n = y(x_n)$.

i. Trapezium rule (1-strip): $\int_{x_0}^{x_1} y(x) dx \approx (h/2)[y_0 + y_1]$.

ii. Simpson's rule (2-strip): $\int_{x_0}^{x_2} y(x) dx \approx (h/3)[y_0 + 4y_1 + y_2]$.

(c) Richardson's extrapolation method: Let $I = \int_a^b f(x) dx$ and let I_1, I_2 be two estimates of I obtained by using Simpson's rule with intervals h and $h/2$.

Then, provided h is small enough,

$$I_2 + (I_2 - I_1)/15,$$

is a better estimate of I .

1. Probabilities for events

For events $A, B,$ and C	$P(A \cup B) = P(A) + P(B) - P(A \cap B)$
More generally $P(\cup A_i) =$	$\sum P(A_i) - \sum P(A_i \cap A_j) + \sum P(A_i \cap A_j \cap A_k) - \dots$
The <u>odds</u> in favour of A	$P(A) / P(\bar{A})$
<u>Conditional probability</u>	$P(A B) = \frac{P(A \cap B)}{P(B)}$ provided that $P(B) > 0$
<u>Chain rule</u>	$P(A \cap B \cap C) = P(A)P(B A)P(C A \cap B)$
<u>Bayes' rule</u>	$P(A B) = \frac{P(A)P(B A)}{P(A)P(B A) + P(\bar{A})P(B \bar{A})}$
A and B are <u>independent</u> if	$P(B A) = P(B)$
$A, B,$ and C are <u>independent</u> if	$P(A \cap B \cap C) = P(A)P(B)P(C),$ and $P(A \cap B) = P(A)P(B), P(B \cap C) = P(B)P(C), P(C \cap A) = P(C)P(A)$

2. Probability distribution, expectation and variance

The probability distribution for a discrete random variable X is the complete set of probabilities $\{p_x\} = \{P(X = x)\}$

Expectation $E(X) = \mu = \sum_x xp_x$

Sample mean $\bar{x} = \frac{1}{n} \sum_k x_k$ estimates μ from random sample x_1, x_2, \dots, x_n

Variance $\text{var}(X) = \sigma^2 = E\{(X - \mu)^2\} = E(X^2) - \mu^2,$ where $E(X^2) = \sum_x x^2 p_x$

Sample variance $s^2 = \frac{1}{n-1} \left\{ \sum_k x_k^2 - \frac{1}{n} \left(\sum_j x_j \right)^2 \right\}$ estimates σ^2

Standard deviation $\text{sd}(X) = \sigma$

If value y is observed with frequency n_y

$$n = \sum_y n_y, \sum_k x_k = \sum_y yn_y, \sum_k x_k^2 = \sum_y y^2 n_y$$

For function $g(x)$ of $x,$ $E\{g(X)\} = \sum_x g(x)p_x$

Skewness $\beta_1 = E\left(\frac{X - \mu}{\sigma}\right)^3$ is estimated by $\frac{1}{n-1} \sum \left(\frac{x_i - \bar{x}}{s}\right)^3$

Kurtosis $\beta_2 = E\left(\frac{X - \mu}{\sigma}\right)^4 - 3$ is estimated by $\frac{1}{n-1} \sum \left(\frac{x_i - \bar{x}}{s}\right)^4 - 3$

Sample median \tilde{x} . If the sample values x_1, \dots, x_n are ordered $x_{(1)} \leq x_{(2)} \leq \dots \leq x_{(n)}$

$$\tilde{x} = x_{(\frac{n+1}{2})} \text{ if } n \text{ is odd, and } \tilde{x} = \frac{1}{2}(x_{(\frac{n}{2})} + x_{(\frac{n+2}{2})}) \text{ if } n \text{ is even.}$$

α -quantile $Q(\alpha)$ is such that $P(X \leq Q(\alpha)) = \alpha$

Sample α -quantile $\hat{Q}(\alpha)$ is the sample value for which the proportion of values $\leq \hat{Q}(\alpha)$ is α (using linear interpolation between values on either side)

The sample median \tilde{x} estimates the population median $Q(0.5)$.

3. Probability distribution for a continuous random variable

The cumulative distribution function (cdf) $F(x) = P(X \leq x) = \int_{x_0=-\infty}^x f(x_0)dx_0$

The probability density function (pdf) $f(x) = \frac{dF(x)}{dx}$

$$E(X) = \mu = \int_{-\infty}^{\infty} x f(x)dx, \quad \text{var}(X) = \sigma^2 = E(X^2) - \mu^2,$$

$$\text{where } E(X^2) = \int_{-\infty}^{\infty} x^2 f(x)dx$$

4. Discrete probability distributions

Discrete Uniform *Uniform* (n)

$$p_x = \frac{1}{n} \quad (x = 1, 2, \dots, n) \quad \mu = \frac{1}{2}(n+1), \quad \sigma^2 = \frac{1}{12}(n^2-1)$$

Binomial distribution *Binomial* (n, θ)

$$p_x = \binom{n}{x} \theta^x (1-\theta)^{n-x} \quad (x = 0, 1, 2, \dots, n) \quad \mu = n\theta, \quad \sigma^2 = n\theta(1-\theta)$$

Poisson distribution *Poisson* (λ)

$$p_x = \frac{\lambda^x e^{-\lambda}}{x!} \quad (x = 0, 1, 2, \dots) \quad (\text{with } \lambda > 0) \quad \mu = \lambda, \quad \sigma^2 = \lambda$$

Geometric distribution *Geometric* (θ)

$$p_x = (1-\theta)^{x-1} \theta \quad (x = 1, 2, 3, \dots) \quad \mu = \frac{1}{\theta}, \quad \sigma^2 = \frac{1-\theta}{\theta^2}$$

5. Continuous probability distributions

Uniform distribution *Uniform* (α, β)

$$f(x) = \begin{cases} \frac{1}{\beta - \alpha} & (\alpha < x < \beta), \\ 0 & (\text{otherwise}). \end{cases} \quad \begin{aligned} \mu &= (\alpha + \beta)/2, \\ \sigma^2 &= (\beta - \alpha)^2/12. \end{aligned}$$

Exponential distribution *Exponential* (λ)

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & (0 < x < \infty), \\ 0 & (-\infty < x \leq 0). \end{cases} \quad \begin{array}{l} \mu = 1/\lambda, \\ \sigma^2 = 1/\lambda^2. \end{array}$$

Normal distribution $N(\mu, \sigma^2)$

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left\{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2\right\} \quad (-\infty < x < \infty)$$
$$E(X) = \mu, \quad \text{var}(X) = \sigma^2$$

Standard normal distribution $N(0, 1)$

If X is $N(\mu, \sigma^2)$, then $Y = \frac{X - \mu}{\sigma}$ is $N(0, 1)$

6. Reliability

For a device in continuous operation with failure time random variable T having pdf $f(t)$ ($t > 0$)

The reliability function at time t $R(t) = P(T > t)$

The failure rate or hazard function $h(t) = f(t)/R(t)$

The cumulative hazard $H(t) = \int_0^t h(t_0) dt_0 = -\ln\{R(t)\}$

The Weibull(α, β) distribution has $H(t) = \beta t^\alpha$

7. System reliability

For a system of k devices, which operate independently, let

$$R_i = P(D_i) = P(\text{"device } i \text{ operates"})$$

The system reliability, R , is the probability of a path of operating devices

A system of devices in series operates only if every device operates

$$R = P(D_1 \cap D_2 \cap \dots \cap D_k) = R_1 R_2 \dots R_k$$

A system of devices in parallel operates if any device operates

$$R = P(D_1 \cup D_2 \cup \dots \cup D_k) = 1 - (1 - R_1)(1 - R_2) \dots (1 - R_k)$$

8. Covariance and correlation

The covariance of X and Y $\text{cov}(X, Y) = E(XY) - \{E(X)\}\{E(Y)\}$

From pairs of observations $(x_1, y_1), \dots, (x_n, y_n)$ $S_{xy} = \sum_k x_k y_k - \frac{1}{n} (\sum_i x_i) (\sum_j y_j)$

$$S_{xx} = \sum_k x_k^2 - \frac{1}{n} (\sum_i x_i)^2, \quad S_{yy} = \sum_k y_k^2 - \frac{1}{n} (\sum_j y_j)^2$$

Sample covariance $s_{xy} = \frac{1}{n-1} S_{xy}$ estimates $\text{cov}(X, Y)$

Correlation coefficient $\rho = \text{corr}(X, Y) = \frac{\text{cov}(X, Y)}{\text{sd}(X) \cdot \text{sd}(Y)}$

Sample correlation coefficient $r = \frac{S_{xy}}{\sqrt{S_{xx} S_{yy}}}$ estimates ρ

9. Sums of random variables

$$E(X + Y) = E(X) + E(Y)$$

$$\text{var}(X + Y) = \text{var}(X) + \text{var}(Y) + 2 \text{cov}(X, Y)$$

$$\text{cov}(aX + bY, cX + dY) = (ac) \text{var}(X) + (bd) \text{var}(Y) + (ad + bc) \text{cov}(X, Y)$$

If X is $N(\mu_1, \sigma_1^2)$, Y is $N(\mu_2, \sigma_2^2)$, and $\text{cov}(X, Y) = c$,
then $X + Y$ is $N(\mu_1 + \mu_2, \sigma_1^2 + \sigma_2^2 + 2c)$

10. Bias, standard error, mean square error

If t estimates θ (with random variable T giving t)

Bias of t $\text{bias}(t) = E(T) - \theta$

Standard error of t $\text{se}(t) = \text{sd}(T)$

Mean square error of t $\text{MSE}(t) = E\{(T - \theta)^2\} = \{\text{se}(t)\}^2 + \{\text{bias}(t)\}^2$

If \bar{x} estimates μ , then $\text{bias}(\bar{x}) = 0$, $\text{se}(\bar{x}) = \sigma/\sqrt{n}$, $\text{MSE}(\bar{x}) = \sigma^2/n$, $\widehat{\text{se}}(\bar{x}) = s/\sqrt{n}$

Central limit property if n is fairly large, \bar{x} is from $N(\mu, \sigma^2/n)$ approximately

11. Likelihood

The likelihood is the joint probability as a function of the unknown parameter θ .

For a random sample x_1, x_2, \dots, x_n

$$\ell(\theta; x_1, x_2, \dots, x_n) = P(X_1 = x_1 | \theta) \cdots P(X_n = x_n | \theta) \quad (\text{discrete distribution})$$

$$\ell(\theta; x_1, x_2, \dots, x_n) = f(x_1 | \theta) f(x_2 | \theta) \cdots f(x_n | \theta) \quad (\text{continuous distribution})$$

The maximum likelihood estimator (MLE) is $\hat{\theta}$ for which the likelihood is a maximum.

12. Confidence intervals

If x_1, x_2, \dots, x_n are a random sample from $N(\mu, \sigma^2)$ and σ^2 is known, then the 95% confidence interval for μ is $(\bar{x} - 1.96 \frac{\sigma}{\sqrt{n}}, \bar{x} + 1.96 \frac{\sigma}{\sqrt{n}})$

If σ^2 is estimated, then from the Student t table for t_{n-1} we find $t_0 = t_{n-1, 0.05}$

The 95% confidence interval for μ is $(\bar{x} - t_0 \frac{s}{\sqrt{n}}, \bar{x} + t_0 \frac{s}{\sqrt{n}})$

13. Standard normal table

Values of pdf $\phi(y) = f(y)$ and cdf $\Phi(y) = F(y)$

y	$\phi(y)$	$\Phi(y)$	y	$\phi(y)$	$\Phi(y)$	y	$\phi(y)$	$\Phi(y)$	y	$\Phi(y)$
0	.399	.5	.9	.266	.816	1.8	.079	.964	2.8	.997

16. The chi-squared goodness-of-fit test

The frequencies n_y are grouped so that the fitted frequency \hat{n}_y for every group exceeds about 5.

$$X^2 = \sum_y \frac{(n_y - \hat{n}_y)^2}{\hat{n}_y} \text{ is referred to the table of } \chi_k^2 \text{ with significance point } p,$$

where k is the number of terms summed, less one for each constraint, eg matching total frequency, and matching \bar{x} with μ .

17. Joint probability distributions

Discrete distribution $\{p_{xy}\}$, where $p_{xy} = P(\{X = x\} \cap \{Y = y\})$.

Let $p_{x\bullet} = P(X = x)$, and $p_{\bullet y} = P(Y = y)$, then

$$p_{x\bullet} = \sum_y p_{xy}, \text{ and } P(X = x | Y = y) = \frac{p_{xy}}{p_{\bullet y}}$$

Continuous distribution

Joint cdf $F(x, y) = P(\{X \leq x\} \cap \{Y \leq y\}) = \int_{x_0=-\infty}^x \int_{y_0=-\infty}^y f(x_0, y_0) dx_0 dy_0$

Joint pdf $f(x, y) = \frac{d^2 F(x, y)}{dx dy}$

Marginal pdf of X $f_X(x) = \int_{-\infty}^{\infty} f(x, y_0) dy_0$

Conditional pdf of X given Y = y $f_{X|Y}(x|y) = \frac{f(x, y)}{f_Y(y)}$ (provided $f_Y(y) > 0$)

18. Linear regression

To fit the linear regression model $y = \alpha + \beta x$ by $\hat{y}_x = \hat{\alpha} + \hat{\beta}x$ from observations $(x_1, y_1), \dots, (x_n, y_n)$, the least squares fit is

$$\hat{\alpha} = \bar{y} - \bar{x}\hat{\beta}, \quad \hat{\beta} = S_{xy}/S_{xx}$$

The residual sum of squares $RSS = S_{yy} - \frac{S_{xy}^2}{S_{xx}}$

$$\hat{\sigma}^2 = \frac{RSS}{n-2}, \quad \frac{n-2}{\sigma^2} \hat{\sigma}^2 \text{ is from } \chi_{n-2}^2$$

$$E(\hat{\alpha}) = \alpha, \quad E(\hat{\beta}) = \beta,$$

$$\text{var}(\hat{\alpha}) = \frac{\sum x_i^2}{n S_{xx}} \sigma^2, \quad \text{var}(\hat{\beta}) = \frac{\sigma^2}{S_{xx}}, \quad \text{cov}(\hat{\alpha}, \hat{\beta}) = -\frac{\bar{x}}{S_{xx}} \sigma^2$$

$$\hat{y}_x = \hat{\alpha} + \hat{\beta}x, \quad E(\hat{y}_x) = \alpha + \beta x, \quad \text{var}(\hat{y}_x) = \left\{ \frac{1}{n} + \frac{(x - \bar{x})^2}{S_{xx}} \right\} \sigma^2$$

$$\frac{\hat{\alpha} - \alpha}{\widehat{se}(\hat{\alpha})}, \quad \frac{\hat{\beta} - \beta}{\widehat{se}(\hat{\beta})}, \quad \frac{\hat{y}_x - \alpha - \beta x}{\widehat{se}(\hat{y}_x)} \text{ are each from } t_{n-2}$$

19. Design matrix for factorial experiments With 3 factors each at 2 levels

$$X = \begin{pmatrix} 1 & -1 & -1 & 1 & -1 & 1 & 1 & -1 \\ 1 & 1 & -1 & -1 & -1 & -1 & 1 & 1 \\ 1 & -1 & 1 & -1 & -1 & 1 & -1 & 1 \\ 1 & 1 & 1 & 1 & -1 & -1 & -1 & -1 \\ 1 & -1 & -1 & 1 & 1 & -1 & -1 & 1 \\ 1 & 1 & -1 & -1 & 1 & 1 & -1 & -1 \\ 1 & -1 & 1 & -1 & 1 & -1 & 1 & -1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \end{pmatrix}$$

2005 Please write on this side only, legibly and neatly, between the margins

QUESTION

SOLUTION

E1

$$A = \begin{pmatrix} 2 & \sqrt{6} & 0 \\ \sqrt{6} & 1 & 0 \\ 0 & 0 & 3 \end{pmatrix}$$

$$\lambda_3 = 3 \quad \left| \begin{array}{cc} 2-\lambda & \sqrt{6} \\ \sqrt{6} & 1-\lambda \end{array} \right| = 0 \Rightarrow \lambda^2 - 3\lambda - 4 = 0$$

$$\lambda_1 = 4; \quad \lambda_2 = -1 \quad \lambda_3 = 3$$

$$\lambda_1 = 4: \begin{pmatrix} -2 & \sqrt{6} & 0 \\ \sqrt{6} & -3 & 0 \\ 0 & 0 & -1 \end{pmatrix} \begin{pmatrix} p \\ q \\ r \end{pmatrix} = 0 \quad p = q\sqrt{3/2}, \quad \underline{a}_1 = \sqrt{\frac{2}{5}} \begin{pmatrix} \sqrt{3/2} \\ 1 \\ 0 \end{pmatrix} = \begin{pmatrix} \sqrt{3/5} \\ \sqrt{2/5} \\ 0 \end{pmatrix}$$

$$\lambda_2 = -1 \begin{pmatrix} 3 & \sqrt{6} & 0 \\ \sqrt{6} & 2 & 0 \\ 0 & 0 & 4 \end{pmatrix} \begin{pmatrix} p \\ q \\ r \end{pmatrix} = 0 \quad q = -p\sqrt{2}, \quad \underline{a}_2 = \sqrt{\frac{2}{5}} \begin{pmatrix} 1 \\ -\sqrt{2} \\ 0 \end{pmatrix} = \begin{pmatrix} \sqrt{2/5} \\ -\sqrt{3/5} \\ 0 \end{pmatrix}$$

$$\lambda_3 = 3 \quad \underline{a}_3 = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$$

Choose P such that

$$P = (\underline{a}_1 \underline{a}_2 \underline{a}_3)$$

$$\therefore AP = (\lambda_1 \underline{a}_1 \lambda_2 \underline{a}_2 \lambda_3 \underline{a}_3)$$

$$= P\Lambda \quad \Lambda = \begin{pmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_2 & 0 \\ 0 & 0 & \lambda_3 \end{pmatrix}$$

$$\therefore P^{-1}AP = \Lambda = \begin{pmatrix} 4 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 3 \end{pmatrix}$$

$$P = \begin{pmatrix} \sqrt{3/5} & \sqrt{2/5} & 0 \\ \sqrt{2/5} & -\sqrt{3/5} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

Acceptable to write out $P^{-1}AP$ longhand but time-consuming

QUESTION

4

Please write on this side only, legibly and neatly, between the margins

SOLUTION

$$\lambda \geq 0 \text{ because } P(N = r + 1) \geq 0 \text{ and } P(N = r)/(r + 1) \geq 0.$$

2

$$\lambda = 0 \text{ implies } P(N = r + 1) = 0 \text{ for } r = 0, 1, 2, \dots, \text{ so } P(N = 0) = 1.$$

2

$$P(N = r + 1) = \frac{\lambda}{r+1} P(N = r) = \frac{\lambda}{r+1} \frac{\lambda}{r} P(N = r - 1).$$

2

$$P(N = r) = \frac{\lambda}{r} P(N = r - 1) = \dots = \frac{\lambda^r}{r!} P(N = 0)$$

2

$$1 = \sum_{r=0}^{\infty} P(N = r) = \sum_{r=0}^{\infty} \frac{\lambda^r}{r!} P(N = 0) = e^{\lambda} P(N = 0),$$

4

$$\text{so } P(N = r) = e^{-\lambda} \lambda^r / r!.$$

$$P(N = r | N > 0) = P(N = r \cap N > 0) / P(N > 0)$$

4

$$= (e^{-\lambda} \lambda^r / r!) \div (1 - e^{-\lambda}) \quad (r = 1, 2, \dots)$$

$$E(N | N > 0) = \sum_{r=1}^{\infty} r (e^{-\lambda} \lambda^r / r!) / (1 - e^{-\lambda})$$

4

$$= (1 - e^{-\lambda})^{-1} e^{-\lambda} \lambda \sum_{r=1}^{\infty} \lambda^{r-1} / (r-1)! = \lambda / (1 - e^{-\lambda}).$$
